
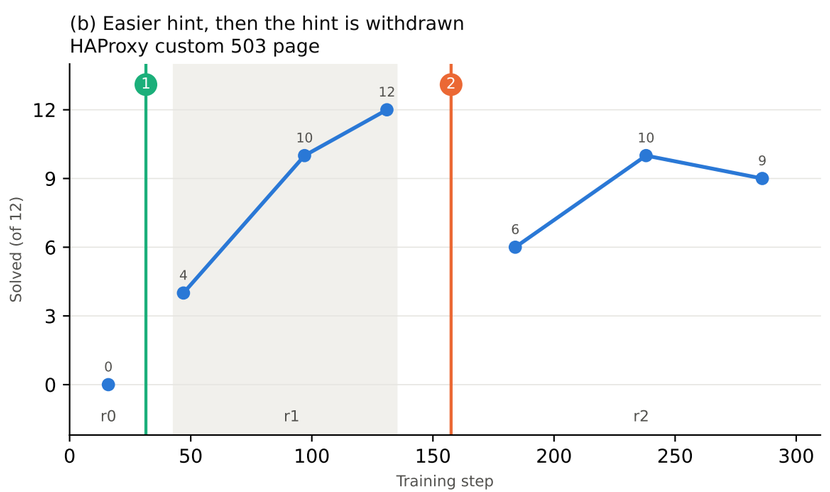
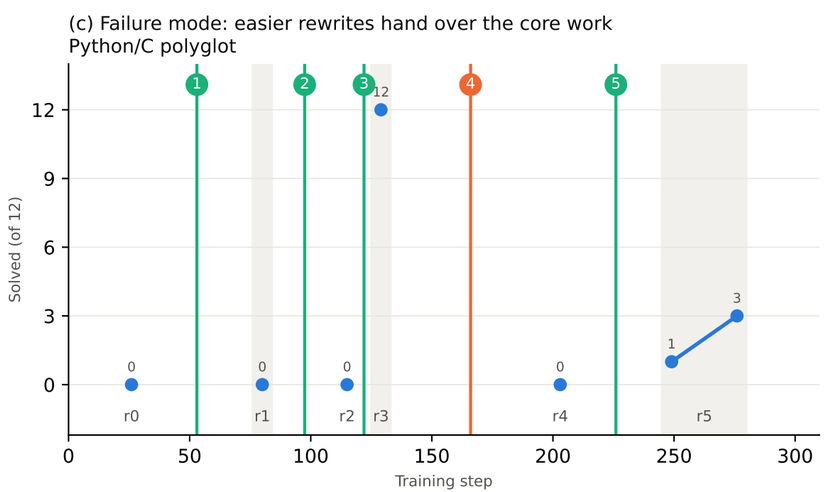
1. [harder] Instruction adds: the certificate 'must pass default hostname verification for https://localhost:8443/ when used as the client's trust anchor'. Old solutions used CN-only certs + curl -k; the fix (subjectAltName) is not stated.
2. [harder] Also require TLS 1.3 clients (accepted after the task's last trained group).



1. [easier] Instruction adds one sentence: confirm the running HAProxy config actually uses the custom 503 page (no syntax given); verifier now checks a live 503 response.
2. [harder] Withdraw the added sentence: instruction restored to the original wording (live-response check kept).



1. [easier] Narrow N from 0-100 to 0-5.
2. [easier] Require only N=0; hint at C preprocessor vs Python strings.
3. [easier] Ship the working C implementation as a header (core work handed over).
4. [harder] Harder rewrite.
5. [easier] Ship only a C output helper; hint the wrapper structure.
